

Hydraulic System

force magnification

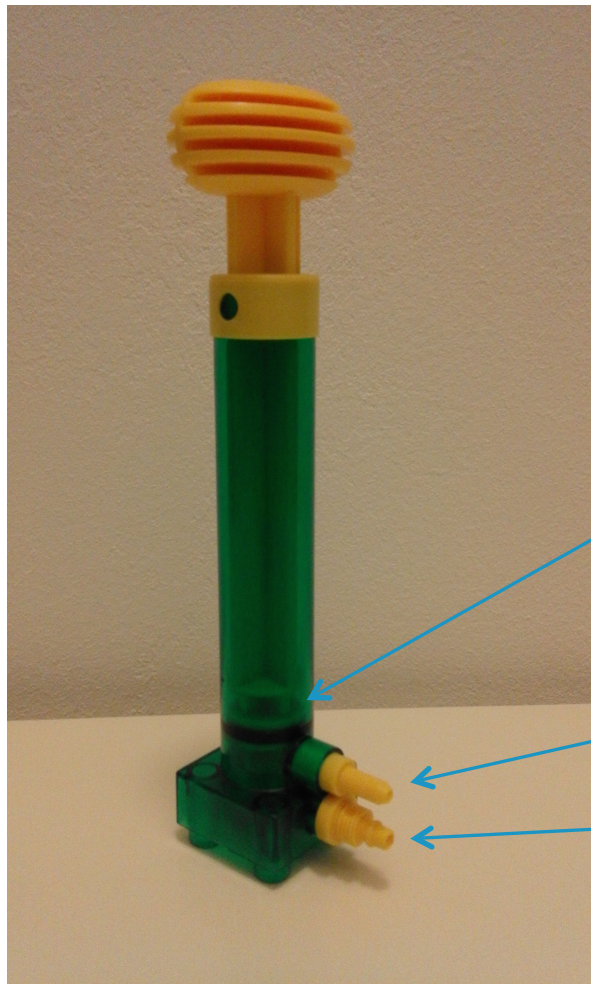

Our aim(=Ziel).....

We want to raise up a heavy book, but to use only a fourth of the weight force of the book.

$\frac{1}{4}$ of the force

Hydraulic Pump

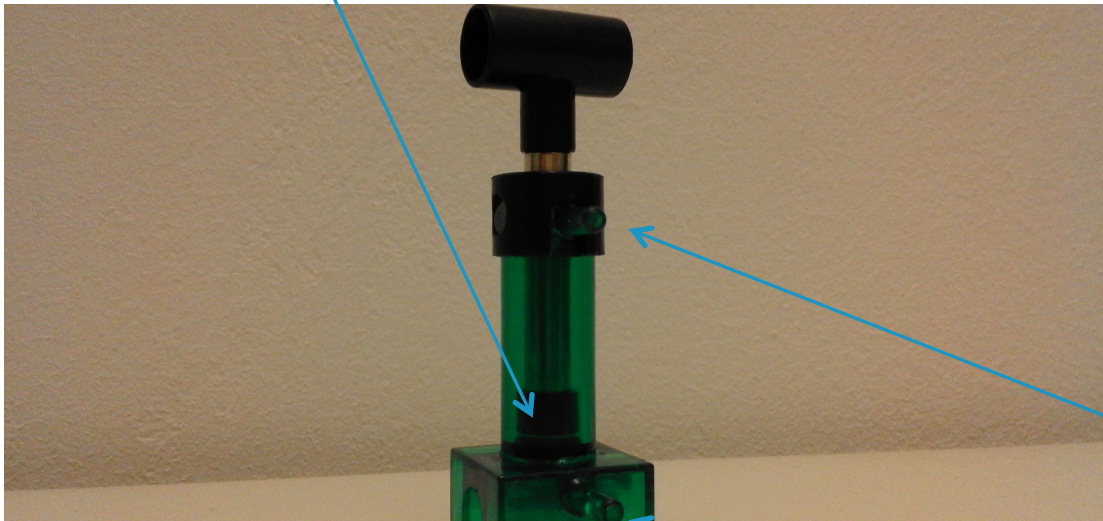

Piston (=Kolben), moved by air/water

Valve (=Ventil) for air/water going IN

Valve for air/water going OUT

Hydraulic Cylinder

Piston moved by water/air

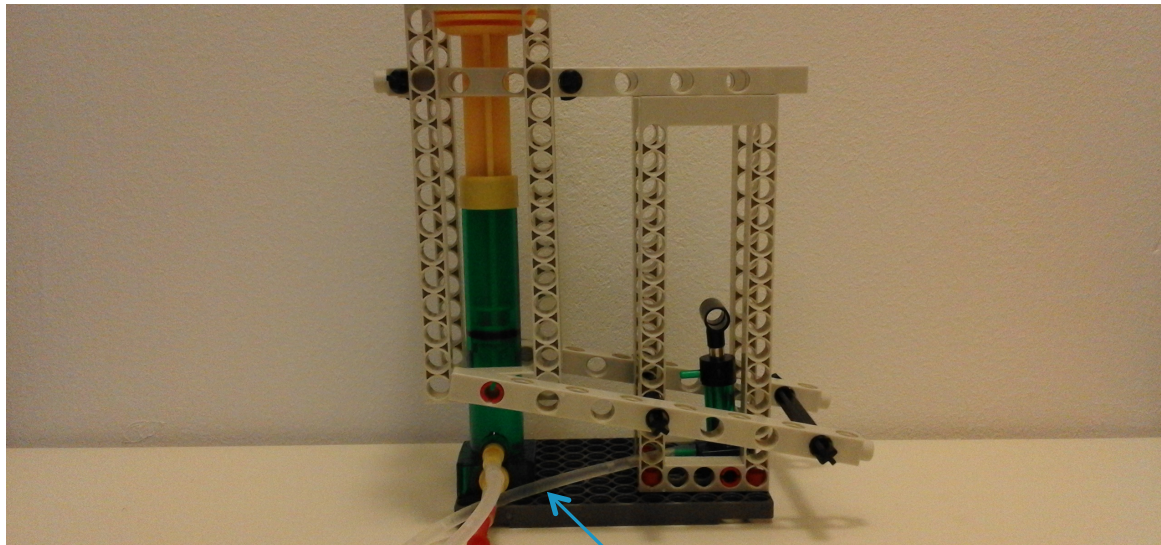

Valve for air/water going IN/OUT

Valve for air/water going OUT/IN

Physical background

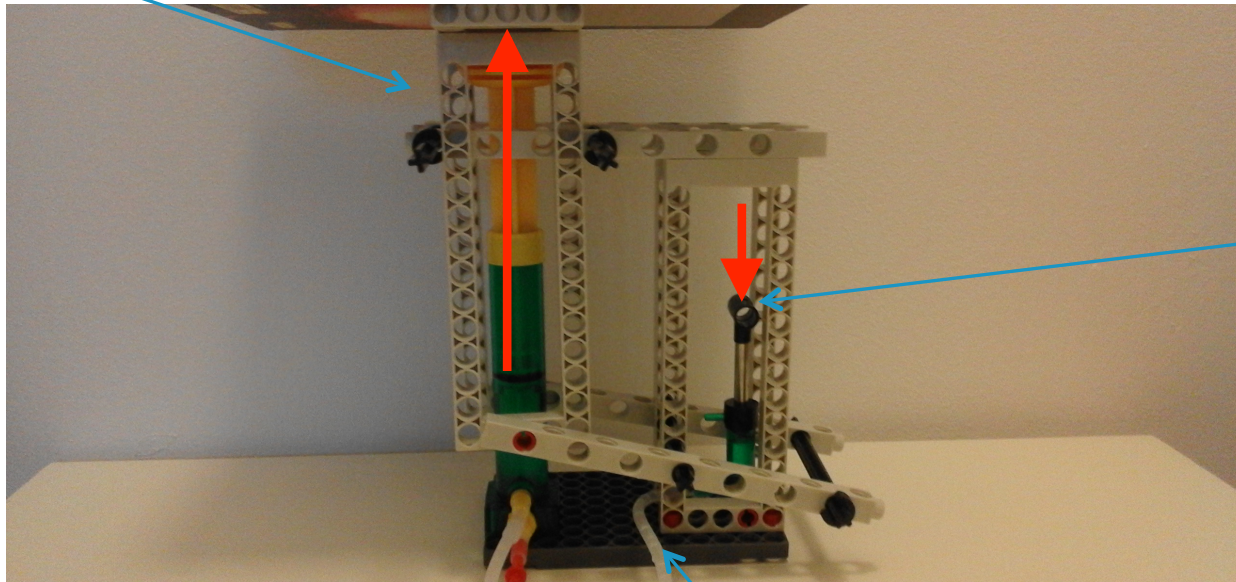

- Pressure in ideal (non-viscous) fluids (e.g. water)
- Neglection of fluid weight
- Pressure p is the same in pump, cylinder and hose (=Schlauch)!

Pump and cylinder are connected

Let's go!!

3. Book is raised up by the pump

1.press

2. Water flows through the hose

What is the secret behind the experiment?

Pressure $p = \text{const.}$

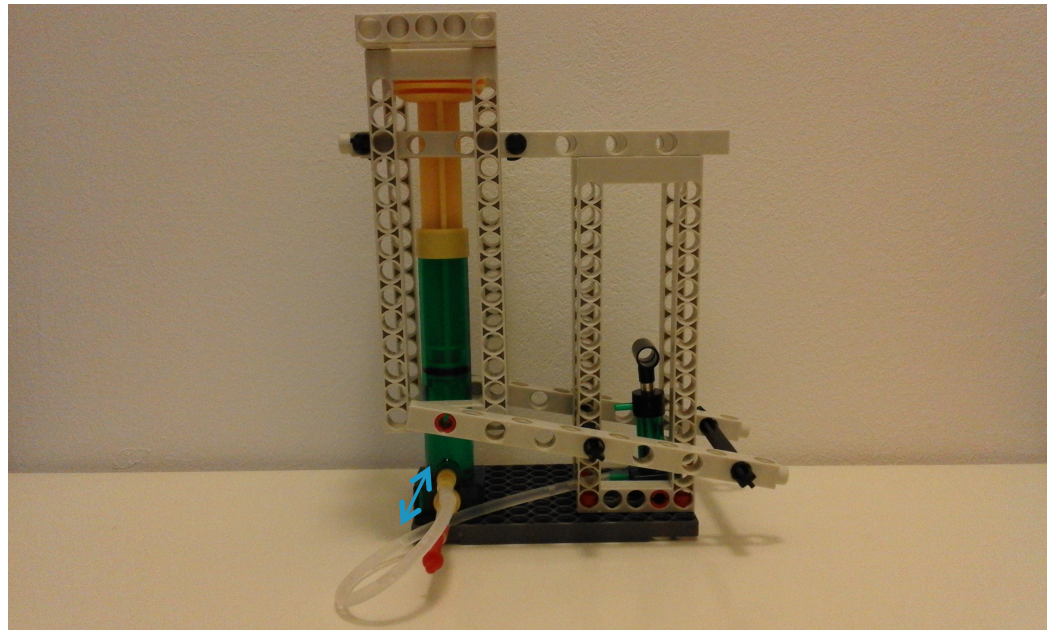

- * Force $F = \text{pressure } p * \text{area } A$
- * Force on piston (=Kolben) $F_{\text{piston}} = p * A_{\text{piston}}$
- * $A_{\text{piston,pump}} = 4 * A_{\text{piston,cylinder}}$
- $F_{\text{piston,pump}} = 4 * F_{\text{piston,cylinder}}$ (the force is magnified **four times**)

Work = Force times path = $F * s = \text{const.}$

- * $F_{\text{piston,pump}} * s_{\text{piston,pump}} = F_{\text{piston,cylinder}} * s_{\text{piston,cylinder}}$
- * $s_{\text{piston,cylinder}} = (F_{\text{piston,pump}} / F_{\text{piston,cylinder}}) * s_{\text{piston,pump}} = 4 * s_{\text{piston,pump}}$
- * (but the cylinder needs to be moved **four times more** than the pump is moving)

How to do the experiment again

If you want to repeat the experiment you have to change the two hoses.

Thank you for your
attention!!!!!!
